

Spaceport Notes

- Compared to other colony infra, a spaceport is of nontrivial but only moderate complexity.
- It is analogous to a small airport, with components being:
 1. Landing/launch pad
 2. Control and navigation facilities
 3. Refueling equipment
 4. Loading/unloading facilities
 5. Blast shielding
- Constraints:
 1. Cannot physically lie within a dome
- Materials per attempt: 1.46 total
 - Base metals: 0.2 T2
 - * Makes up about 1/6 of total materials - steel/aluminum (T2) for structural frames, refueling equipment, etc.
 - Building materials: 1.0 T1, 0.2 T2
 - * Suppose 80% of materials are simple (T1) and can be based on relatively unprocessed regolith
 - * Suppose 20% of materials are more specialized (T2) composites, ceramics, etc.
 - Advanced metals: 0.05 T1, 0.01 T2
 - * Relatively few, but sensors, navigation equipment, electronics, etc. require standard T1 (copper) and T2 (sensor/chip) advanced metals
 - Fuels: N/A (the refueling equipment itself does not require fuel to construct)
 - Chemicals:
 - Biomaterials: N/A
 - Nuclear materials: N/A
