

# Construction Site Notes

- User flow:
  1. Click on a zone
  2. Click button to start designing a building. Each building type can have its own button.
  3. Initiating design enters a new "blueprint mode", where you specify any desired details of the building - this creates a hypothetical building "blueprint" visible at the zone. Only one such blueprint can exist per zone at a time.
    - Building details include building type, tolerance to environmental conditions, quality, etc., which determine materials required per construction step attempt, number of successful attempts required to complete, and expected value of step attempts and materials spent to complete
  4. Upon confirming details, a small amount of construction materials are immediately allocated, and a construction site is created. There should be another interface mode that describes any construction sites or completed buildings in the zone, which should be able to support multiple of these existing at once (scrolling through them). These specifications should reflect the player's current posterior belief about the building, but may not have actually been implemented fully (update belief upon specific evidence arising).
  5. When a construction site and construction crew are selected, the construction crew can be attached to the site.
  6. During the end of the turn, checks should be rolled to make progress on the site, using up materials over time.
    - It should be toggleable by a construction site whether these rolls will be shown to the player or automated. Whether they are shown should never affect the outcome.
    - Minister theft can occur via either direct theft of materials, theft of wages of crew(s), and/or using a substandard amount of materials to create a slightly off-blueprint building and keeping the excess
  7. Upon completion, the building is created where the site was, and the construction crew(s) are unattached.
- A pre-built module acts as the above, but selecting the pre-built module item opens up a selector to create a deployment site in some zone in the location, which opens a blueprint mode with pre-filled, immutable details, and with a very abbreviated construction process.
- Designing a contracted (or built on-site) module or spaceship, or an engineered microbe, or a variety of equipment should use a very similar system.
- Idea - potentially have about 6 progress steps required for each building, but each success can give some number of progress steps.
